

In this paper, a new user-friendly model for Rogowski coils is presented and validated. The model's simplicity stems from utilizing information solely from the Rogowski coil datasheet.

Developed a 3D model of transmitter and receiver coils for dynamic wireless charging, achieving an estimated efficiency of 92.1% and using a closed-loop three-level cascaded PI ...

Introduction to elmerfem module for circuit equations and FE model coupling: Stranded, massive and foil windings; homogenization; parallel simulations (MPI). Basic usage and the role in 3-phase power ...

Temporary transportation braces for the core and coil should not generally be required, and should only be allowed with special approval and instructions for use formally documented.

What is the Elmer Circuit Builder? Python module to automate circuit-matrix creation based on circuit connections (terminal/pin convention) Electrical Components Available: oVoltage Sources (V) ...

The model geometry consists of the spiral-shaped copper inductor with feed lines, the printed circuit board (PCB), and the surrounding air. Figure 1 shows the inductor and PCB domains used in the model.

In this section we will implement the basic electrical component models twice. The first time through, we will implement each component without any regard to the others. But the second time through, we'll ...

The Coil feature transforms this lumped excitation into local quantities (electric field and electric current density), and computes lumped parameters of interest such as impedance, and inductance.

Read up on parallel fan-powered boxes to learn more. A parallel fan-powered box takes air out of the room, mixes that with the primary airstream, and runs both through a heating coil and back to the room.

The package can compute electric and magnetic fields of the coils as well as their self- and mutual (for coil arrays) inductances, with or without a magnetic core.

This part lists all terms, definitions and acronyms that may be referenced when specifying an electrical component, device or system for use by the ITER Organization.
