Generally no. Typically fiber is so fragile that the cable either works or it doesn't. IF its crushed/snapped inside, you likely wont even get the link up. Packet loss is more likely to be dirty fiber ends (you can ...

Comprehending fiber optic cable link loss makes it easier to design, install and maintain extended reach networks. Once you know your link loss, you can safely run pieces of fiber before ...

Short of moving the router around, I recommend trying things like swapping out your Ethernet cables for newer ones, testing different ports, and testing every device separately to see ...

It's what led me down the rabbit hole or researching better router traffic shaping algorithms and ultimately building my own router. Making your own router is no different than building your...

Learn how to troubleshoot fiber networks. Identify common issues like high loss, dirty connectors, and signal drops, with practical solutions for optical links.

To determine the power budget and power margin needed for fiber-optic connections, you need to understand how signal loss, attenuation, and dispersion affect transmission.

Learn about fiber optic signal loss, its causes, measurement techniques, and strategies to reduce attenuation for high-speed, reliable network performance.

Insertion loss and return loss can impact fiber network performance - this post explains what they are and gives five tips to reduce their impact.

Types of fiber loss include absorption, scattering, and bending losses: Each type has distinct causes and is influenced by factors like fiber material, wavelength, and environmental conditions.

This post introduces the main fiber loss types, the calculation process of link loss including fiber attenuation, connector loss, and splice loss, calculating power budget and calculating ...
