

# The switch only allows certain MAC addresses to access the network

I'd like a way to easily apply and centrally manage rules to only allow specific MAC addresses to access any of the ports for any of the VLANs on any of my Cisco switches. I have the ...

By default, a switchport can learn a large number of MAC addresses, allowing someone to connect a switch to the access layer and connect multiple unauthorized devices to the corporate network.

It enables an administrator configure individual switch ports to allow only a specified number of source MAC addresses ingressing the port. Its primary use is to deter the addition by ...

MAC filtering is a network access control method where a router or switch allows or blocks devices based on their MAC (Media Access Control) address. Works by keeping an allow list ...

Besides setting a maximum limit on the number of MAC addresses, you can also use port security to filter MAC addresses. In the following example I configured port security so it only allows MAC ...

In this lesson, you will learn how to configure port security to restrict the number of MAC addresses per port, specify which MAC addresses are allowed, and control what happens when violations occur.

Port security is a layer two traffic control feature on Cisco Catalyst switches. It enables administrators to configure individual switch ports to allow only a specified number of source MAC ...

MAC filtering enhances security by allowing only devices with specific MAC addresses to connect to a port, effectively controlling access based on hardware identifiers. MAC filtering is about access ...

Port security on a Cisco IOS switch is a security feature that restricts input to an interface by limiting and identifying MAC addresses that are allowed to access the port.

Port security is a security feature of Cisco switches that allows you to control what source MAC addresses are allowed to enter a switchport.
