

By understanding the differences between OSFP-IHS and OSFP-RHS, and by carefully matching Finned Top, Closed Top, or Flat Top OSFP modules to the target platform, network ...

They represent different optical module cooling methods, and different structures bring different results. So what are the actual differences between OSFP IHS vs. OSFP RHS, and what ...

OSFP Riding Heat Sink (OSFP-RHS) is a 9.5mm high pluggable module which does not have an integrated heat sink. In place of SFP's integrated heat sink, OSFP-RHS cage shall have a riding heat ...

This article introduces two thermal designs for OSFP IHS and OSFP RHS optical modules, explaining their main differences in structure, heat dissipation methods, and system ...

This article introduces two thermal designs for OSFP IHS and OSFP RHS optical modules, explaining their main differences in structure, heat ...

Learn the key differences between OSFP IHS and RHS thermal designs, how they impact module compatibility, and how to choose the right options for AI, HPC, and data center deployments.

You're choosing between two fundamentally different physical architectures -- OSFP-IHS (Integrated Heat Sink) and OSFP-RHS (Riding Heat Sink) -- that determine which equipment you ...

The RHS design moves the primary thermal management responsibility from the module to the host system. The flat top of the module is designed to make intimate contact with a cold plate or a system ...

As 800G and 1.6T optics increase power density, OSFP thermal design becomes critical. Learn the differences between OSFP-IHS and OSFP-RHS, and how Finned Top, Closed Top, and ...

OSFP transceiver module with riding heat sink (OSFP-RHS)--The OSFP-RHS is a 9.5 mm tall pluggable module that is used in place of the standard integrated heat sink.

The evolution of OSFP thermal form factors reflects a broader trend in data center design: thermal management has become a system-level co-design challenge between optical modules and host...
